Election Security & Operations

Manage All Phases of Your Election Cycle Operations

Use DLAN to manage activities such as: creating pre-planned checklists and templates, inspections, resource deployment, election site reporting, demobilization of assets, and data collection for after action analysis.

Safeguarding Election Integrity

DLAN incident management system (IMS) can significantly enhance the efficiency and effectiveness of election operations at polling stations, playing a crucial role in bolstering election security for polling districts by providing a structured framework for identifying, reporting, and responding to security incidents. DLAN allows for the early detection of security threats through real-time incident reporting. Polling station staff can promptly alert election officials to any suspicious activities, cybersecurity breaches, or other security incidents, enabling swift action to mitigate potential risks.

Real-Time Situational Awareness

DLAN allows election officials to centralize incident reports and track the status of each issue and allocate resources accordingly, ensuring that critical issues are prioritized and resolved in a timely manner.

DLAN facilitates communication and coordination among polling station staff, election officials, and relevant stakeholders through the use of instant messaging, status board/landing page updates and notifications, so that everyone involved is informed and can collaborate effectively to address incidents.

In the event of emergencies or unexpected situations (weather events, power outages, etc.) DLAN enables authorities to monitor activities in real-time, coordinate emergency response efforts, and mobilize resources to ensure situations are addressed swiftly and effectively.

Pre-Election Activities

DLAN incident management system (IMS) provides the necessary framework for your organization's pre-election preparations, including primary and backup site assessments. Easily build pre-planned response protocols to ensure that all stakeholders know their roles and responsibilities. Plans and checklists are integrated into DLAN to help ensure necessary resources, such as cybersecurity tools, personnel, and backup systems, are accounted for and ready to be deployed in case of an incident.

Ease of Use & Just-in-Time Training

In many cases, your organization may need to enlist assistance from volunteers or temporary staff who may face technical challenges, and DLAN is intuitive enough for users to adopt with minimum training. Security groups within the system give administrators full control over user interface and experience.

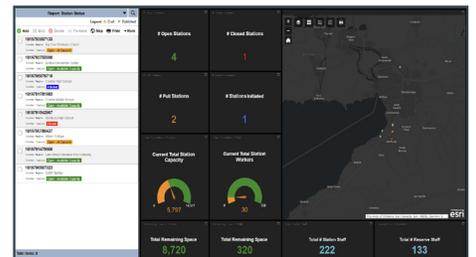

Election Day Continuity of Operations

DLAN provides polling station staff with the ability to check facility readiness and report incidents (such as equipment malfunctions, voter disputes, or security concerns) in real-time. The system facilitates coordination with other governmental and non-governmental agencies to pool resources and expertise by effectively establishing clear communication channels for reporting and responding to incidents.

Post-Election Activities

DLAN provides mission critical tools for all aspects of post-election operations, including demobilization of equipment, inventory and asset management, after-action reporting, and preparation for your next election/event. Throughout the operation, the system compiles and analyzes collected data to identify lessons learned and improve future operations. By default, DLAN provides the perfect framework for investigations into the root cause of an incident, positioning you for success in future elections.
